/Preparation of 2-aminothiazole. Boguslaw Bedroicki,
Tadeusz Jakubiec, and Janusz Tomaszewski, Med. Akad.,
Wroclaw, Poland. Rocznik Chemii, 26, 1891-7 (1952).

attempting to prep. 2-aminothiazole (I) from tribromopropenaldehyde (II) and thiourea (III). [Lettsch and Friedman, U.S. 2,236,962 (C.A. 35, 32702)]. a tarry brown mass was obtained instead of I; presumably because, in the absence of water, II did not polymerize to react with III. The synthesis was modified as follows: 24.8 ml. II was added during 3 hrs. with stirring to 30 g. propaldehyde and 120 ml. water with the temp. kept at 33-35°; the colorless mixt. treated with 30 g. III, and stirring continued 4 hrs. at 75-80°; neutralization with 50% NaOH (about 140 ml.), to litmus at 35°, extn. with five 60-ml. portions of Et₂O, drying with K₂CO₃, and distil. at 15 mm. gave 38-40 g. (60%) pure I, b.p. 90°.

Syntheses of *p*-phenethylaminine derivatives. II. —
Phenyl-2-amino-*n*-butane. Ryszard Bobruński (Acad.
Med. Wroclaw, Poland). *Zeszyty Nauk. Farm.* 10, 1-8
(1953) (English summary). — The substitution of H by
alkyl radicals in position α to the NH₂ group of PhCH₂-
CH₂NH₂ and its effect on the pharmacol. action of thus
formed amines has been studied. For this purpose, *1*-
phenyl-2-aminobutane, *—pentane* and *—hexane* were prep'd.
from PhCH₂CN. The syntheses are described in detail.
The intermediate compds. isolated in the prepn. of the 3
amines were: phenylpropionylacetonitrile and Et benzyl
ketone, phenylbutyrylacetonitrile and Pr benzyl ketone,
and phenylvalerylacetonitrile and Bu benzyl ketone, resp.
1-Phenyl-2-aminoketone is a new compd.; it is an oily liquid,
b.p. 130-42°; it has a very unpleasant odor and absorbs CO₂
from the air. Pharmacol. examm. of the above 3 amines
showed that substitution for the H on the position α to the
NH₂ group causes increase of toxicity in all cases, except in
the case of *1-phenyl-2-aminobutane* whose toxicity is about
five times lower than that of benzedrine. The analeptic
action of the new compds. was found to be very slight. The
compds. cause an increase of blood pressure. E. A. A. *Not of*

Semi-micro-ebulliometric apparatus for the determination of
molecular weight. In Polanyi, *Brown, et al.* 1947, 29, 461.
An improved semi-micro-ebulliometric apparatus based on the
semi-micro ebulliometer of Siedentopf and Leibnitz, *Chemical
Methods for the Elementary Analysis of Organic Compounds*,
V. Wallenberger, London, 1938, is described and illustrated. By
introducing electric heating and separate tubes for vapor and gas or
solvent phases, a satisfactory standard of reproducibility is obtained.
The apparatus is suitable for low to high molecular weight molecules
of determinations (mol. wt. 148-452) with methanol, benzene,
diethyl pyridine, acetic acid and amine are tabulated. The accuracy
is $\pm 5\%$ for mol. wt. 148-352.

4
Relation of ganglio-blocking action to the structure of bis-(quaternary ammonium salts). Jozefina Bohrnicka-Tadeusz Jakubiec, and Anna Piotrowska (Inst. Immunol. Terap. i Endokrynol. PAN, Wroclaw, Poland).

Arch. Immunol. Ther. Exp. 1983, Dostęp do nr 353-9 (1983). — The therapeutic index of pendiamine was compared to those of dichloride of bis[2-(*N*-methylmorpholino)ethyl] sulfide, m. 223-7°, dichloride of bis[2-(*N*-methylpiperidino)ethyl] sulfide, m. 274-5°, dichloride of bis[2-(*N,N*-diethyl-*N*-methylaminoethyl)] sulfide, m. 253-4°, dichloride of bis[2-(*N*-methylpiperidinoethyl)] sulfoxide, m. 239-40°, *p*-xylenebis(*N*-methylmorpholine bromide), m. 255-8°, *p*-xylenebis(*N*-methylpiperidine bromide), m. 260-2°, and *p*-xylenebis(*N*-methylpiperidine bromide), m. 224-5°, and found to be, resp., 1, 0.27, 0.14, 1.8, 0.2, 0.38, 0.06, and 0.03.

L. J. Piotrowski //

✓Compounds blocking the functions of the autonomic ganglia. Geguslaw Bobrowski, Tadeusz Jakubow, and Danuta Ffelci. *Doktorowosci Farm.* 8, 249-53 (1958). On heating methylbis[β -bromoethyl]amine (I) in alk. soln with both tertiary aliphatic and heterocyclic amines the corresponding bisquaternary dibromides with Pendiomol-like structure have been obtained. The following compds. have been prepd.: P₁ from I and diethylmethylamine, P₂ from I and o-aminobenzylamine, P₃ from I and N-methyl-piperidine, P₄ from I and N-ethylpiperidine, P₅ from I and N-methylmorpholine, P₆ from I and N-methylpyrrolidine.

The pharmacol. investigation of these compds. showed that some of these have a more favorable therapeutic coeff. than pendiomol. This refers especially to P₁, P₂, and P₅. Some of these, viz., P₁ and P₂ are free from tachyphylaxis. P₅ exhibits tachyphylaxis to a very slight degree. J. H.

✓ 149. A new automatic apparatus for the determination of ten-milligram quantities of carbon and nitrogen in organic substances. B. Boberński (Pharm. Inst. of Medical Acad., Wrocław, Poland). Mikrochim. Acta, 1958, (12), 1735-1746 (in German).

The variation of pressure in the combustion tube produced by the combustion of the sample is used for automatically regulating the rate of heating. The micro-boat containing the sample is heated by high-frequency induction. The current in the high-frequency generator is controlled by a manometer. The combustion proceeds under constant pressure and therefore in an excess of oxygen. Diagrams of the combustion-tube train, oxygen-pressure regulator, manometer, H.F. electrodes and

to distinguish between azo dyes and I. Fairly large amounts of barbiturates (80 mg) were needed to give the reaction. Steam-distillation in acid, alkaline, and neutral media failed to split the I-barbiturate complex quantitatively, and it is suggested that column chromatography be used for the effective separation of Averell-positive compounds.

Abstract : In continuation of the work begun earlier (see report I, Ref Zhur-Khim, 1957, 19216), the structure of the product which is formed under the action of I_2 in the absence of HI on 5,5-diallylbarbituric acid (I), both in an acid and in an alkaline medium, was examined. The product obtained differed in composition from the earlier-prepared I under the action of I_2 on I in a weak alkaline medium (Bougault, J., Guillou, J., C. r. Acad. sci., 1931, 193, 463).

TITLE: Synthesis and properties of 1-p-iodophenyl-5,5-diallyl barbituric acid

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 21, 1962, 180, abstract 21Zh179 (Arch. immunol. i terap. doświadcz. v. 9, no. 4, 1961, 593 - 598 [Eng.; summaries in Pol. and Russ.])

TEXT: 1-p-iodophenyl-5,5-diallyl barbituric acid (I) was synthesized and pharmacologically examined. Experiments showed no sedative effect of I on mice. 30 g of POCl_3 is added to a boiling mixture of 10 g of $\text{CH}_2(\text{COOH})_2$ dried over P_2O_5 , 26 g of p-iodophenyl urea (II) dried at 120°C and 100 ml of absolute CHCl_3 within 1 hr. Then the mixture is boiled for 7 hrs, CHCl_3 is distilled off in vacuo, the residue is poured into ice water, and 1-p-iodophenyl barbituric acid (III) is finally obtained: $\text{C}_{10}\text{H}_7\text{IN}_2\text{O}_3$; yield 89%; m.p., 230 - 232°C (from alcohol). 20 mmoles of III and 42mmoles

Card 1/2

Synthesis and properties of...

S/081/62/000/021/025/069
B117/B101

of allyl bromide are added to the C_2H_5ONa solution synthesized from 0.04 g-atom of Na and 15 ml of absolute alcohol. Then the mixture is kept at 55 - 60°C for about 3 hrs until the alkaline reaction with phenol phthalein ceases; it is subsequently poured into cold water, and finally I is obtained: $C_{16}H_{15}IN_2O_3$; yield, 77%; m.p., 177 - 178°C (from alcohol). A mixture of 25 mmoles of dry diallyl malonic acid, 25 mmoles of dry II, 30 mmoles of $(CH_3CO)_2O$, and 50 ml of absolute $CHCl_3$ is boiled for 3 - 4 hrs, $CHCl_3$ is distilled off in vacuo, the residue is mixed with alcohol, and I is filtered off (yield, 50%). When administered per os DL_{50} of I is 3 g/kg. Doses of 1/5 DL_{50} have no analgesic effect and do not affect the spontaneous mobility of mice. Doses of 1/3 DL_{50} do not influence the blood pressure in five hours. [Abstracter's note: Complete translation.]

AUTHORS: Bobralski, Bogusław, Konieczny, Mieczysław

TITLE: Synthesis and properties of 1-cyano-1,3-diacetyl-2-imino indane

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 24, 1962, 344, abstract 24Zh231 (Roczn.chem., v.36, nr.4, 1962, 639-644 [Eng.; summaries in Pol. and Russ.])

TEXT: Condensation of $\text{o}-(\text{CH}_2\text{CN})_2\text{C}_6\text{H}_4$ (I) with ethyl acetate yields cyanoacetyl imino indane (II) whose structure was confirmed by reactions and synthesis from cyano-imino indane (III). The product expected to form was o -di-(α -cyanoacetyl)-benzene. Hydrolysis of II yielded IV which by action of P_2O_5 again becomes converted to II. Reaction of dilute H_2SO_4 with II or IV yields a mixture of the indanones (V) and (VI). Boiling of VI with hydrochloric acid yields o -acetonyl phenyl acetic acid (VII). 10 g of I and 17 g ethyl acetate are added to a boiling solution of $\text{C}_4\text{H}_9\text{ONa}$ (obtained from 3.85 g Na and 35 ml $\text{C}_4\text{H}_9\text{OH}$). The mixture is heated

for 2 hrs and left standing in a refrigerator for 7 days. The precipitate is then separated, dissolved in water, and filtered. Approximately 30% II, $C_{14}H_{20}O_2N_2$ m.p. $292^{\circ}C$ (from glacial acetic acid) is precipitated from the filtrate with 1% HCl. In the same way, II is obtained from III. A mixture of IV and P_2O_5 (1:5) is kept at $100^{\circ}C$ for 30 min, left standing for 24 hrs, then water is added and II is obtained. At $100^{\circ}C$, 1.5 g II or 1.6 g IV are dissolved in a mixture containing 7 ml concentrated H_2SO_4 and 2.5 ml H_2O . The solution which is cooled and mixed with 105 ml H_2O , yields 0.315 g VI, $C_{11}H_{10}O_2$, m.p. $122^{\circ}C$ (from aqueous CH_3OH); also the dioxime $C_{11}H_{12}O_2N_2$, m.p. $148^{\circ}C$ (decomp.; from aqueous alcohol). 0.2 g of V m.p. $61^{\circ}C$ (from ether) is extracted from the aqueous solution after separation of VI with ether; also the oxime C_9H_9ON , m.p. $152^{\circ}C$ (from chloroform). Product II is dissolved in a small amount of CH_3COOH mixed with H_2O (2:1). When this is left standing, IV, $C_{14}H_{14}O_3N_2$, m.p. $209^{\circ}C$ (decomp.) separates. Boiling of II in aqueous alcohol or aqueous acetone

Card 2/3

for 15 hrs also yields IV. A solution of 0.3 g VI in 9 ml 25% HCl is boiled for 10 min and evaporated to dryness. Then water is added to the residue, the solution is filtered and again evaporated to dryness yielding 0.22 g VII, $C_{11}H_{12}O_3$, m.p. 44°C (from benzene-petroleum ether); ether compounds formed were: S-benzyl-iso-thiuronium salt (obtained by reaction of the sodium salt of VII with S-benzyl-iso-thiuronium chloride) $C_{19}H_{22}N_2O_3S$, m.p. 136°C; 2,4-dinitrophenyl hydrazone, $C_{17}H_{16}O_6N_4$, m.p. 172-174°C (from alcohol). TITLE: Multichannel recorder

SOURCE: Avtomatika i priborostroyeniye, no. 3, 1965, 54-55

TOPIC TAGS: data recording, data processing, multichannel analyzer, multitrack recording, statistic analysis, data transmission, electronic device, communication equipment

ABSTRACT: Numerous processes are investigated by statistical analyzers which incorporate devices for the registration of results. The majority of such devices are either extremely cumbersome and expensive or utilize single channels preventing the simultaneous registration of data. The present article describes a comparatively simple recorder which simultaneously registers, with a reasonable degree of accuracy, the results of the analysis of random quantities in twenty channels. This device, developed at the Kiyevskoye otdeleniye Tsentral'nogo nauchno-issledovatel'skogo instituta svyazi (Kiev Department, Central Scientific-Research Institute of Communications) is based on the scaling of electrical impulses arriving from statistical analyzers. The block diagram of the recorder and the basic triggering scaler circuit are presented and their operation is described. The device is presently in use at the Kiev and Moscow communication centers in conjunction with the study of statistical characteristics of interferences and interruptions during transmission of data. Orig. art. has: 2 figures.

TITLE: Counter for conversion of numbers from the binary to the decimal system

SOURCE: Avtomatika i priborostroyeniye, no. 4, 1965, 31-32

TOPIC TAGS: pulse counter, binary code

ABSTRACT: A binary-to-decimal converter, particularly useful for the conversion of large numbers, was developed at the Kiev branch of the Central Scientific Research Institute of Communication. A block diagram is shown in Figure 1. Input circuit 1

after the entry of the binary number to be converted causes pulse generator 4 (1 Mc) to send pulses to binary counter 7 and decimal counter 6 through inhibit circuit 3. When the count in 7 is equal to the number at the input, block 2 causes inhibit circuit with memory 3 to close the gate connecting generator 4 with the two counters. After the decimal equivalent stored in 6 has been read out, both counters are reset to 0, and the inhibit signal in 3 is lifted. The capacity of the converter is limited by the capacity of the binary counter, which is $2^{21} - 1$. The counters use nonsaturating

TITLE: A computer distribution loop system with binary cells

SOURCE: Mekhanizatsiya i avtomatizatsiya upravleniya, no. 4, 1966, 62

TOPIC TAGS: computer circuit, computer control system, circuit design, flip flop circuit, transistorized circuit

ABSTRACT: A computer distribution system with a scaling factor twice higher than the number of cells is described with the help of a circuit diagram. It is mentioned that an application, No. 943983/26-24, for a patent covering this arrangement was presented by P. I. Darova. The system shown in a diagram consists of three flip-flop circuits having a scaling factor equal to 6. The system operates by using transistors for consecutive switching of pulses to the corresponding coincidence output units. The interconnecting operation of three flip-flop circuits are briefly explained. It is expected that the proposed system will find a wide application in designing various distributing, coding and decoding arrangements. Orig. art. has: 1 diagram.

limits of the probability P of error in the reception of a character, because $P = 1 - S$. The present article offers a more accurate estimate of P . It is found that: (1) The upper estimate of P expressed in terms of the probability function χ^2 of the Pearson correspondence criterion may deviate from the true value of P by several orders of magnitude; this discrepancy substantially increases with (a) the correlation factor r (which characterizes the relation between the shifts of borders of the start-stop combination), (b) the channel-characteristics improvement, and (c) the receiver margin; (2) The upper estimate of P yields an incorrect conclusion that the reception fidelity with independent errors is lower than that with correlated errors; (3) According to the new more accurate formulas, P decreases by the factor of $1/n$ when r increases from 0 to 1 (where n is the number of working borders in the code combination); for $n = 2$, the variation of r from 0 to 0.7 practically does not affect P . Orig. art. has: 2 figures and 42 formulas.

TITLE:

What's new in astronautics - The moon is the target
of the second stage

PERIODICAL:

Věda a technika mládeži, no. 10, 1962, 349

TEXT:

The popular science article briefly describes the targets of Soviet cosmic research and the principles of the ion engine. The second stage of Soviet cosmic research started with the launching of the Cosmos I, II, and III satellites, and is aimed at long-duration cosmic flights, namely to the moon. Such flights will be especially feasible during the next three years, since the solar activity, having a direct influence on the active-radiation intensity, will be minimum during this period. The first two Cosmos satellites are already in extended orbits (apogee 1,5600 km, perigee 213 km) to measure the distribution of active-radiation belts around the earth and the behavior of various high-temperature resisting materials such as plastics, sili-

con-fiber laminates, cermets, etc. The problems of radiocommunication between high-altitude satellites and ground stations have generally been solved except for disturbances of cosmic origin as encountered in the scientific laboratory launched to the Venus. More urgent is the solution of propulsion problems. Most promising is the ion engine which has already passed laboratory tests in the USSR. These engines are based on the principles of positive-ion acceleration in an electric field, and the required electric power is obtained from a small nuclear reactor with a steam cycle, driving a 5A/25,000V turbogenerator. Rb or Cs is used as ion source, and the ions, accelerated by a 10,000V electrostatic field, obtain escape velocities of over 300 km/sec. Due to their small traction, ion engines will be used for propulsion in high altitudes and for reentry maneuvers, while liquid-propelled engines will still be used for spacecraft launching. According to Soviet scientists, research in this field will be conducted within the next three to four years. There are 2 figures.
